¹ X = A (120VAC, large electrical enclosure), B (24VAC, large electrical enclosure), C (Line voltage, small electrical enclosure [Y junction box]).
 Large electrical enclosure A and B include a contactor, transformer, and printed circuit board with fuses.
 If using your own temperature control device, a remote contactor may be required. Customers can also supply their own remote mount control circuit/enclosure.
 Ensure control devices comply to local electrical code and meets the heater's electrical ratings and is suitable for the area's hazardous atmosphere classification.
² All 10 kW heaters include a 1/4" (6.35 mm) diameter 304 stainless steel safety guard pre-installed over the outlet grills.
 Supply voltage must be within +/- 10% of rated heater voltage. Actual output (kW) = [(Line voltage)² ÷ (Rated voltage)²] x Rated unit wattage (kW).
 For best heat distribution and comfort, a wall mount thermostat is recommended.
 Note: BTX1 and XET1 thermostats are not designed to switch three-phase heaters directly. A factory built-in electrical enclosure (A or B), or customer supplied, remote mount, "Control Circuit" is required.
 Standard color is red.
 600 are available upon request.

Electrical Fundamentals

Ohm's Law

The relationship between Wattage (heat) output and the applied Voltage of electric resistance heating elements is determined by a precise physical rule defined as Ohm's Law which states that the current in a resistance heating element is directly proportional to the applied Voltage. Ohm's Law is traditionally expressed as:

$$I = \frac{E}{R} \quad \text{Where: } I = \text{Amperes (Current)}$$

$$E = \text{Voltage}$$

$$R = \text{Ohms (Resistance)}$$

The same equation using the conventional abbreviation for voltage is:

$$I = \frac{V}{R} \quad \text{Where: } I = \text{Amperes (Current)}$$

$$V = \text{Voltage}$$

$$R = \text{Ohms (Resistance)}$$

An unknown electrical value can be derived by using any two known values in one of the variations of Ohm's Law shown at the right.

VOLTS

$$\text{VOLTS} = \sqrt{\text{WATTS} \times \text{OHMS}}$$

$$\text{VOLTS} = \frac{\text{WATTS}}{\text{AMPERES}}$$

$$\text{VOLTS} = \text{AMPERES} \times \text{OHMS}$$

AMPERES

$$\text{AMPERES} = \frac{\text{VOLTS}}{\text{OHMS}}$$

$$\text{AMPERES} = \frac{\text{WATTS}}{\text{VOLTS}}$$

$$\text{AMPERES} = \sqrt{\frac{\text{WATTS}}{\text{OHMS}}}$$

OHMS

FAQ

What is required for properly sizing a heater in my room?

- If you have a room with 8 feet ceiling height; you can calculate the square footage times 10 watts per square foot.
- If your ceiling is higher than 8 feet; calculate the cubic footage L x W x H and multiply by 1 watt per cubic foot .
- If you plan on heating a garage calculate the cubic footage L x W x H and multiply by 1 watt per square foot and multiply the square footage for each garage door by 48 (watts per square foot) and add this amount to the cubic footage. This will be the amount required to heat the garage.

Are 120 volts and 240 volts heaters interchangeable?

- A 240 volts heater run at 120 volts will produce 1/4 of the rated wattage. A 120 volts heater run at 240 volts will be destroyed and could cause fire damage to the building.

If I know the BTU's required; how do I calculate the watts required?

- Watts = BTU/3.412 (1 Watt = 3.41 BTU)

Calculating Temperature Rise?

- Sometimes your heater does not feel like it is putting out enough heat. Why not, you ask?
- Temperature rise is calculated by taking the kW times the constant 3167 divided by the CFM. For instance:
5kW x 3167/300CFM = 15835/300CFM = 52.8 °F. If your ambient temperature is 60 °F the outlet air is 112 °F.
